1 Software

1. Windows(In this case , we use Windows7(32)).
2. Autodesk 3ds Max 2012 32-bit.
3. Fbx file converter or model editor.

2 Production process

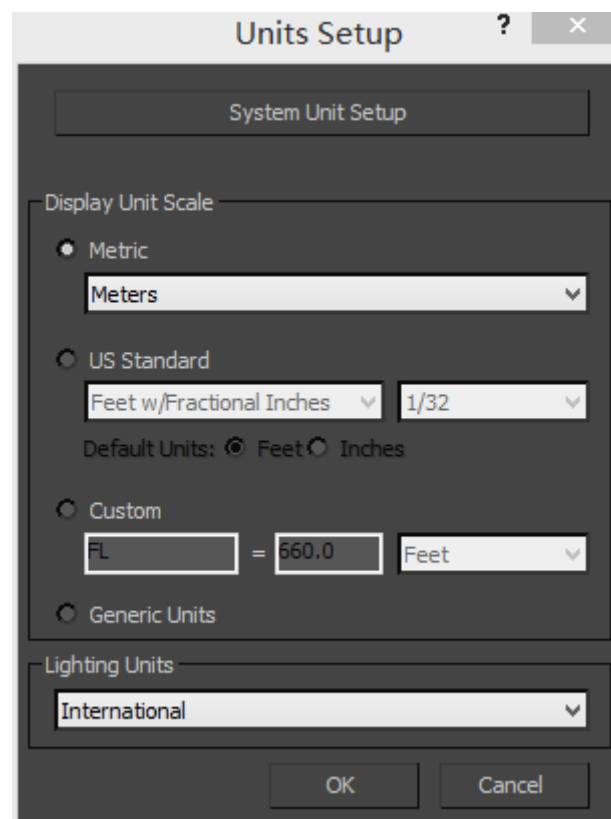

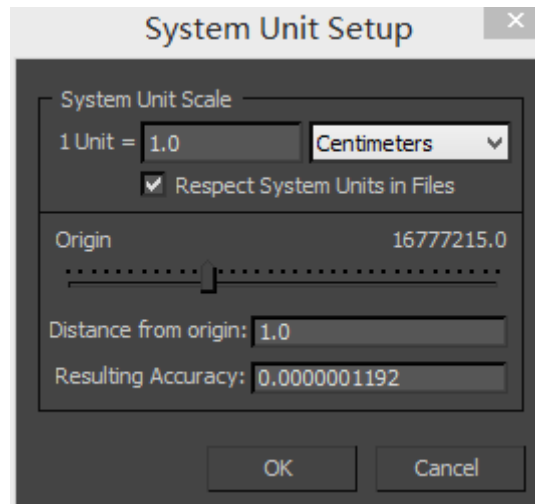

3 Production requirements

- 1: The root bone should not participate in the skin process, including CS and non CS bones.
- 2: Without affecting the artistic effect, the number of bones should be using as little as possible (For example, In hand glove mode, you should prepare 2 fingers and 2 finger links bone for a hand with glove, If you don't need the finger animation, it's unnecessary to prepare additional bones for it)
- 3: The vertices on the skin are most affected by 4 bones.
- 4: All the animations of a model should be in a single MAX file.
- 5: The name of all the parts of a model and corresponding textures must be in lowercase Latin letters.
- 6: Before starting create skin and action for a model, please ensure that all parts of the model had been coordinate to 0, and processed by "reset xforms".
- 7: When you export a model form 3DMax, make sure "Y-up" be selected.

- 8: Unit size must be unified among all you models, please refer to the following settings:

When you export a model from 3DMax, ensure the centimeters is selected:

9: It is recommended to use centimeters as the default modeling unit, when you uses fbx plug-in to export your model, keeping "centimeters" selected. Our plugin will convert "centimeters" to "meter", which is the default modeling unit in Cocos3D.
